Problem Statement

Many people struggle to manage their personal finances because they do not track their daily expenses. Without proper tracking, it becomes difficult to stay within a budget and control spending.

This project aims to create a simple console-based Expense Tracking System using C++ that helps users record their expenses and monitor their budget efficiently.

Proposed Solution

The solution is a menu-driven C++ application that allows users to manage their expenses.

Key Features:

- Set a monthly budget
- Add expense details (name, category, amount)
- View all recorded expenses
- View budget summary and remaining balance
- Warning when expenses exceed the budget

The system uses Object-Oriented Programming concepts such as classes, objects, and encapsulation.

Working of the System

Conclusion

The Expense Tracking System helps users manage their personal finances efficiently. It allows users to record expenses, monitor their spending, and stay within their budget.

This project demonstrates the use of C++ programming concepts such as classes, arrays, loops, functions, and menu-driven programming.

The system can be further improved by adding file storage, graphical interface, and advanced financial analysis features.
